

FRENIC-Mini Series

FRENIC

FUJI INVERTERS

GREAT PERFORMANCE IN A COMPACT PACKAGE WELCOME TO THE NEW GENERATION OF MICRO INVERTERS

MEH451a

FRENIC-Mini Series Concepts

Ideal functions to meet various needs

New, compact design

Simple operation

Flexible through optionals

A broad range of model variations

Fuji Electric is the world's top market share manufacturer* of general-purpose inverters in the 4.0kW class or below. Based on our experience and customer's needs, we have now integrated our advanced designs and industry-leading technologies to develop a new inverter series, called FRENIC-Mini.

The FRENIC-Mini features a full range of functions, compact body, simple operation, wide model variations, and global compatibility. It will meet your needs for higher performance in machines and equipment such as conveyors, fans, pumps, centrifugal separators and food processing machines, as well as the needs for system integration, energy saving, labor saving, and total cost reduction.

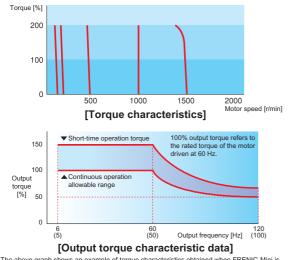

Optimum performance for traversing conveyors

High starting torque, at 150% or more

Equipped with Fuji's original simplified torque-vector control system and the automatic torque boost function, the inverter provides consistent powerful operation (when automatic torque boost is ON, slip compensation control is ON, and when running at 5Hz or more).

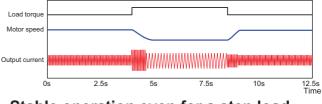

*The above graph shows an example of torque characteristics obtained when FRENIC-Mini is combined one-to-one with Fuji's standard three-phase motor (8-type series: 4 poles).

Braking resistor connectable to the inverter

Owing to a built-in braking transistor (0.4kW or larger), an optional braking resistor can be connected to increase the regenerative braking capacity for conveyance and transportation machinery that require large braking power. For inverters of 1.5kW or larger, it is possible to select the model that incorporates a braking resistor.

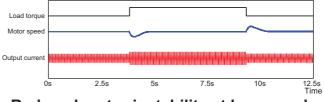

Trip-free operation

The remarkably improved current limiting function (stall prevention) allows trip-free operation even for an impact load.

Stable operation even for a step load

The slip compensation function permits stable operation even when the motor load fluctuates (step load).

Reduced motor instability at low speed

Fuji's unique control method improves voltage control performance and reduces motor instability at low speed to about a half or less (at 1Hz) compared with that of conventional inverters.

The highly used functions for fans and pumps

Automatic energy-saving provided as a standard function

By controlling the motor loss to a minimum, FRENIC-Mini further saves electric power when applied to fans or pumps. *Energy saving rate varies with the motor characteristics.

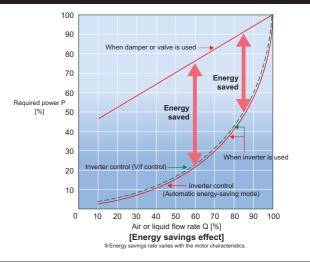

PID control function

Safety Precautions

Permits motor operation while controlling temperature, pressure, or flow rate without using an external device such as temperature controller.

Cooling fan ON/OFF control function

The inverter's cooling fan can be turned off while the fan or pump is stopped for noise reduction and energy savings.

 The contents of this catalog are provided to help you select the product model that is best for you. Before actual use, be sure to read the Instruction Manual/User's Manual thoroughly to assure correct operation.
 This product is not designed and manufactured for use in machines or systems which human life is dependent upon. If you

. This product is not designed and manufactured for use in machines or systems which human life is dependent upon. If you are studying use of the products in this brochure for special purposes such as for control of nuclear power stations, in sea, air or space craft, in medical or land transportation equipment, or any related systems, please contact the business office of Fuji Electric. If these products are to be used in any equipment in which there is a risk to human life or the possibility of a major loss in the event of failure, be sure to install the appropriate safety equipment.

The ideal functions to serve a multiplicity of needs for small-capacity inverters

Compatible with a wide range of frequency settings

A transistor output is provided.

This enables an overload early warning, lifetime forecast or other information signals to be output during operation.

The output frequency can be set to a maximum of 400Hz.

The inverter can be used for equipment that requires a high motor speed such as centrifugal separator. In this case, check the operation in combination with the motor.

Two points can be set for a non-linear V/f pattern.

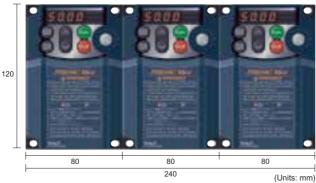

One point for the non-linear V/f pattern, which can be set as desired, has been added (making a total of 2 points), and so the V/f pattern can be adjusted to match the application.

Compact

Side-by-side mounting is possible.

Multiple inverter units can be mounted side-by-side inside a panel. This features helps to minimize the space used for installation. (Ambient temperature: 40 C or less)

(Single-phase 200V, 0.75kW or less)

RS485 communications card (option) can be installed internally.

This card can be installed inside the inverter's body without changing the dimensions. RS485 communications are available as option.

(Single-phase 200V, 0.75kW or less)

Size interchangeability with Fuji's FVR-C11S series is provided.

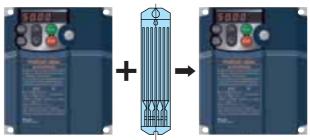

*Applicable models, however, are limited to single-phase and threephase 200V series with semi-standard specifications.

A model with built-in braking resistor is available on order.

For inverters of 1.5 kW or larger, a built-in braking resistor type can be selected.

Since installation and wiring of a separate braking resistor is not required, the total mounting space is reduced.

(Single-phase 200V, 1.5kW)

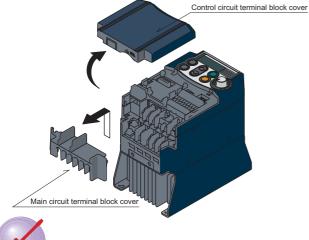

Simple operation and wiring

Frequency setting potentiometer is standard equipment.

The frequency can be adjusted easily by hand.

The control circuit terminal block cover and main circuit terminal block cover can be quickly removed.

All types of data can be displayed on the keypad.

The output frequency, set frequency, load shaft speed, output current, output voltage, alarm history, input power etc. can be displayed.

A menu mode is included in the keypad.

The menu items include the "function menu" for checking or changing function codes, "operation monitor", "I/O check", "maintenance info." and "alarm info." See the FRENIC-Mini User's Manual for details.

Maintenance

The lifetime of the DC bus capacitor can be estimated.

The capacitor's condition compared with its initial state can be confirmed.

A long-life cooling fan is included.

Use of a long-life cooling fan (design life: 7 years with an ambient temperature: 40 C) reduces maintenance work.

Cumulative running time is recorded and displayed.

The inverter records and displays the cumulative running time (lifetime) of the inverter itself, PCB, and cooling fan.

The alarm history for the 4 latest alarms is recorded.

Detailed information from back as far as the 4 latest alarms can also be checked.

It is possible to output lifetime forecast signal to the transistor output.

This signal is output when the capacitors in the DC bus circuit, the electrolytic capacitors on the PCB or the cooling fans are nearing the end of their service life.

Interface for peripheral devices and comprehensive protective functions

All models are equipped with an inrush current suppression circuit.

An inrush current suppression circuit is provided as standard in all models, so the cost of peripheral devices such as input magnetic contactors can be reduced.

A DC reactor (DCR) connection terminal is provided as standard.

A terminal for connection of a DCR, necessary for suppressing harmonics, is provided in all models.

Input/output phase loss protective function

It is possible to detect output phase loss at all times during starting and operation.

Sink/Source can be switched.

The input/output mode (Sink/Source) of the digital input terminals can be switched by means of an internal jumper switch.

The motor can be protected by a PTC thermistor.

In addition to the protection by an electronic thermal relay, the motor is protected by a PTC thermistor input.

Flexible through optionals

Function code copy function

The optional remote keypad panel includes a built-in copy function, so function codes can be set easily in duplicate units.

Inverter support loader software is available.

The inverter support loader program (Windows based), which simplifies setting of function codes, is provided.

Mounting on DIN rail

Using the rail mounting base (option), the inverter can be easily mounted on a DIN rail (35mm wide).

Replacement of older models with new ones is simple.

The latest models can be mounted without drilling additional holes by use of the mouting adapter (option).

Remote operation can be done easily using the optional RS485 communications card, remote keypad and remote operation extension cable.

Remote keypad

Extension cable for remote operation

Wide variations

A 400V series, in addition to the 200V series (single-phase, three-phase), is available.

Models with EMC filter built-in type and with braking resistor built-in type are also available.

Type1 (NEMA1) conformed model is available by attaching optional parts.

Global products

All standard models comply with the EC Directive (CE marking), UL standards and Canadian standards (cUL certification).

All standard FRENIC-Mini inverters comply with European and North American/Canadian standards, enabling standardization of the specifications for machines and equipment used at home and abroad.

If the model with built-in EMC filter is used, the model conforms to the European **EMC** Directive.

Variation

In addition to the single-phase 200V and three-phase 200V, three-phase 400V series has been newly introduced, broadening the model selection range. Model variations include EMC filter built-in type and braking resistor built-in type.

*2) Rated capacity is calculated by regarding the output rated voltage as 220V for three-phase 200V *2) Rated capacity is calculated by regarding the output rated voltage as 2200 for three-phase 2000 series, and as 4400 for three-phase 4000 series.
*3) Output voltage cannot exceed the power supply voltage.
*4) Use the inverter at the current given in () or below when the carrier frequency setting is higher than 4kHz (*F26*: 410 IS) or the ambient temperature is 40°C or higher.
*5) Tested under the standard load condition (85% load for nominal applied motor).
*6) Calculated under Fuji-specified conditions.

 *8) Average braking torque obtained with AVR control OFF (Varies with the efficiency of the motor.) *10) Voltage unbalance [%] = Max voltage [V] - Min voltage [V] - Min voltage [V] - kin vo

in this value is 2 to 3%, use AX REALTOR (AVR).
 *11) NEMA1 kit (option) is required for the enclosure conforming to the UL standard TYPE1 (NEMA1).
 Use the inverter in the ambient temperature range from -10 to +40°C.

The Compact Inverter FRENIC-Mini

	Symbol	Terminal name	Functions	Remarks	Related function code
	L1/R, L2/S, L3/T	Power input	Connect a three-phase power supply.	Three-phase 200V, 400V series	
	L1/L, □, L2/N		Connect a single-phase power supply. (indicates the empty terminal.)	Single-phase 200V, 100V series	
cui	U, V, W	Inverter output	Connect a three-phase induction motor.		
Main circuit	P(+), P1	For DC REACTOR	Connect the DC REACTOR.		
Mair	P(+), N(-)	For DC bus connection	Used for DC bus connection system.		
-	P(+), DB	For EXTERNAL BRAKING RESISTOR	Used for connection of the optional external BRAKING RESISTOR.	Wiring is required for the braking resistor built-in type.	
	🕒 G	Grounding	Ground terminal for inverter chassis	Two terminals are provided.	
	13	Potentiometer power supply	+10V DC power supply for frequency setting potentiometer (1 to $5 k \Omega)$	Allowable maximum output current: 10mA	
It	12	Voltage input (Inverse operation)	0 to +10V DC / 0 to 100% 0 to +5V DC / 0 to 100% or +1 to +5V DC / 0 to 100% can be selected by function setting. +10 to +0V DC / 0 to 100% (switchable by digital input signal)	Input impedance: $22k\Omega$ Allowable maximum input voltage: 15V DC If input voltage is +10V DC or over, the inverter assumes it to be +10V DC.	F18, C32 to C34
ndu		(PID control)	Used for reference signal (PID process command) or PID feedback signal.		E61
og i		(Frequency aux. setting)	Used as additional auxiliary setting to various main settings of frequency.		E61
Analog input	C1	Current input (Inverse operation)	+4 to +20mA DC / 0 to 100% +20 to +4mA DC / 0 to 100% (switchable by digital input signal)	Input impedance: 250Ω Allowable maximum input current: +30mA DC If input voltage is +20mA DC or over, the inverter assumes it to be +20mA DC.	F18, C35 to C37
		(PID control)	Used for reference signal (PID process command) or PID feedback signal.		E62
		(For PTC thermistor)	Connects PTC thermistor for motor protection.	Connect external resistor $1k\Omega$ to terminal 13 - C1.	H26, H27
		(Frequency aux. setting)	Used as additional auxiliary setting to various main settings of frequency.		E62
	11	Common	Common for analog input/output signals (12, 13, C1)	Isolated from terminal CM and Y1E.	
-	X1 X2	Digital input 1 Digital input 2	The following functions can be set at terminals X1 to X3, FWD, and REV for signal input. (FWD and REV functions are factory-set at FWD and REV terminals,	<on state=""> Source current: 2.5 to 5mA (When input voltage is 0V)</on>	E01 to E03
	X3 Digital input 3		respectively. <common function=""></common>	Maximum input voltage: 2V <off state=""></off>	
	FWD Forward operation command		Source/Sink changeover function: Source and sink are changeable using the built-in jumper switch. Contact activation mode changeover function: ON timing can be	Allowable maximum leakage current: 0.5mA Maximum terminal voltage: 22 to 27V	E98, E99
	REV	Reverse operation command	changed between short-circuit of terminals X1 and CM and open circuit of them. The same setting is possible between CM and any of the terminals among X2, X3, FWD, and REV.		
	(FWD)	Forward operation command	(FWD): ON The motor runs in the forward direction. (FWD): OFF The motor decelerates and stops.	When FWD and REV are simultaneously ON, the motor decelerates and stops. This function can	
	(REV)	Reverse operation command	(REV): ON The motor runs in the reverse direction. OFF The motor decelerates and stops.	be set only for the terminals FWD and REV.	
		Multistep freq. selection	 2 (0, 1) different frequencies are selectable. 4 (0 to 3) different frequencies are selectable. 8 (0 to 7) different frequencies are selectable. Frequency 0 indicates the frequency set by the keypad, built-in potentiometer or analog signal. 	Frequency Digital input 0 1 2 3 4 5 6 7 (S51) - ON - ON - ON - ON (S52) - - ON ON - ON ON (S54) - - - ON ON ON ON	C05 to C11
Digital input	(RT1)	ACC/DEC time selection	(RT1): ON ACC/DEC time 2 is effective. (RT1): OFF ACC/DEC time 1 is effective.	Switchable during ACC/DEC operation	E10, E11
Digita	(HLD)	3-wire operation stop command	Used for 3-wire operation. (HLD): ON The inverter self-holds FWD or REV signal. (HLD): OFF The inverter releases self-holding.		
	(BX)	Coast-to-stop command	(BX): ON The inverter output is shut off immediately and the motor will coast-to-stop.	No alarm signal will be output.	
	(RST)	Alarm reset	(RST): ON Faults are reset.	ON signal should be held for more than 0.1s.	
	(THR)	Trip command (External fault)	(THR): OFF The inverter output is shut off and the motor coasts-to-stop.	Alarm signal <mark>CH2</mark> will be output.	
	(JOG)	Jogging operation	(JOG): ON JOG frequency is effective. (FWD):ON or (REV): ON The inverter operates with JOG frequency.		C20, H54
	(Hz2/Hz1)	Freq. set 2/ Freq. set 1	(Hz2):ON or (Hz1): ON Freq. set 2 is effective.		F01, C30
	(WE-KP)	Write enable for KEYPAD	(WE-KP): ON The function code data can be changed from the keypad.	Data can be changed when this function is not allocated.	
	(Hz/PID)	PID control cancel	(Hz/PID): ON The PID control is canceled, and frequency set by multistep frequency, keypad or analog input.		J01 to J06 F01, C30
	(IVS)	Inverse mode changeover	(IVS): ON Operation mode (normal operation/ inverse operation) can be changed.		
		Link enable (RS485, Bus)	(LE): ON The link operation is effective. (RS485 or Bus (Option))		H30, y99
		PID integral/differential reset	(PID-RST): ON PID integration and differentiation are reset.		,,,
	· · · · · · · · · · · · · · · · · · ·	PID integral hold	(PID-HLD): ON PID integration is temporarily stopped.		
	PLC	PLC terminal	Connect to PLC output signal power supply. Common for 24V power (terminal P24).	+24V 50mA max.	
	CM	Common	Common for digital input signal.	Isolated from terminal 11 and Y1E.	

Terminal Functions

The Compact Inverter FRENIC-Mini

The Compact Inverter FRENIC-Mini

	Symbol	Terminal name	Functions	Remarks	Related function code
Analog output	FMA	Analog monitor	Output frequency (Before slip compensation) Output current Output frequency (After slip compensation) Output voltage Input power PID feedback value DC link circuit voltage Analog output test (+)	Voltage output: 0 to 10V Max. current: 2mA Up to two analog voltmeters can be connected.	F30,F31
Ana	11	Common	Common for analog input/output signals (FMA).	Insulated from the terminals CM and Y1E.	
	Y1	Transistor output	The following functions can be set at terminal Y1, signal output. Contact activation mode changeover function: ON timing can be changed by shorting terminals Y1 and Y1E and opening them.	27V max., 50mA max. OFF state maximum leakage current: 0.1mA ON state maximum output voltage: 2V at 50mA	E20
	(RUN)	Inverter running (speed exists)	Comes ON when the output frequency is higher than starting frequency.		
Ē	(RUN2)	Inverter output on	Comes on when the output frequency is higher than the starting frequency or DC injection brake is applied.		
	(FAR)	Speed/freq. arrival	Comes ON when the motor speed reaches the set frequency. (Condition: Operation command is ON.)	FAR hysteresis width (fixed): 2.5Hz	
put	(FDT)	Speed/freq. detection	Comes ON when the output frequency is above the detectable level and goes OFF when below the detectable level.	Hysteresis width (fixed): 1.0Hz	E31
	(LV)	Undervoltage detection	Comes ON when the inverter stops because of undervoltage while the operation command is ON.		
outp	(IOL)	Inverter output limit (limit on current)	Comes ON when the inverter is limiting the current.		F43,F44
Transistor output	(IPF)	Auto-restarting	Comes ON during auto restart operation (after momentary power failure and until completion of restart)		F14
ans	(OL)	Overload early warning (motor)	Comes ON when the electronic thermal relay value is higher than the preset alarm level.		F10 to F12
F	(TRY)	Auto-resetting mode	Comes ON during auto reset mode.		H04,H05
	(LIFE)	Lifetime alarm	Outputs alarm signal according to the preset lifetime level.		H42,H43,H98
	(OLP)	Overload preventive control	Comes ON during inverter control for avoiding overload.		H70
	(ID)	Current detection	Comes ON when a current larger than the set value has been detected for the timer-set time.		E34,E35
	(IDL)	Small current detection	Comes ON when a current smaller than the set value has been detected for the timer-set time.		E34,E35
	(ALM)	Alarm relay (for any fault)	Alarm signal is output as the transistor output signal.		
	Y1E	Transistor output common	Emitter output of transistor output signal (Y1)	Isolated from terminal 11 and CM.	
Relay output	30A,30B, 30C	Alarm relay output (for any fault)	Outputs a contact signal (SPDT) when a protective function is activated to stop inverter. This terminal can be used as the multi-purpose relay output signal. (Possible to select a terminal similar to Y1 for transistor output signal and use it for signal output.) Contact activation mode can be changed between the following two cases: "terminals 30A and 30C are shorted by ON signal output" or "terminals 30B and 30C" are shorted by ON signal output"	Contact rating : 250V AC, 0.3A, cos∳=0.3	E27
LINK	RS485 port connector *1	RS485 I/O terminal	Used to connect the inverter with the remote keypad to supply the power to the keypad. Used to connect the inverter with PC or PLC using RS485 port.	RJ45 connector is used. For the transmission specifications, refer to page 25.	H30 y01 to y10, y99

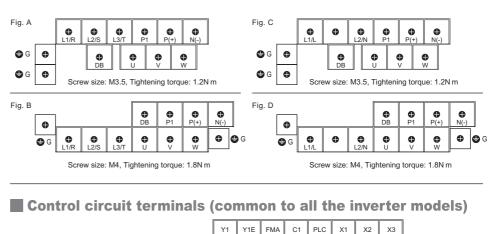

*1) This terminal is valid when the standard inverter is equipped with RS485 communication card (option).

	2.2	FRN2.2C1□-2J**	Fig. B
	4.0	FRN3.7C1□-2J**	

Note) For the inverter type FRN0.1C1D2E/J**, the symbol Dis replaced with either of the following alphabets and ** is replaced with any of the following numeral codes: S (Standard type), E (EMC filters built-in type), **: 21 (Braking resistor built-in type), None (Standard type) The inverter applicable to RS485 communication is limited to the standard ones in three-phase 200V and three-phase 400V series. The braking resistor built-in type is limited to the inverters for 1.5kW or larger

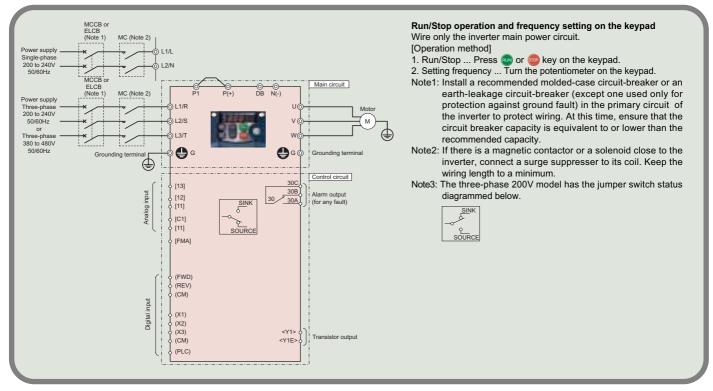

Screw size: M2.5, Tightening torque: 0.4N m

Basic wiring diagram

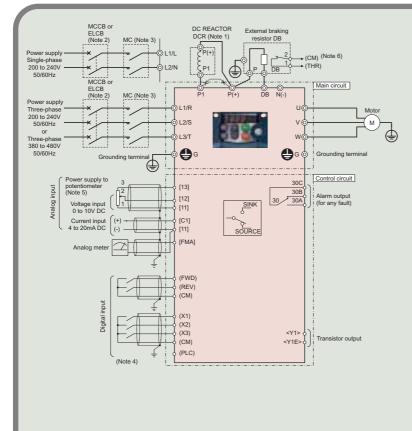

The Compact Inverter FRENIC-Mini

The following diagram is for reference only. For detailed wiring diagrams, refer to the Instruction Manual.

Keypad operation

Operation by external signal inputs

Run/Stop operation and frequency setting through external signals Wire both the inverter main power circuit and control circuit.

By setting "*i*" at *F*^{*G*} *i*, a frequency can be set by using a voltage input (terminal 12) for 0 to 10V DC. By setting "*c*" at *F*^{*G*} *i*, a frequency can be set by using a current input (terminal C1) for 4 to 20mA DC. In both cases, set "*i*" at *F*^{*G*} *i*.

[Operation method]

- Note1: When connecting a DC REACTOR (option), remove the jumper bar from across the terminals [P1] and [P+]. For the single-phase 100V series, the REACTOR connection points differ from the left diagram. For details, refer to the instruction manual.
- Note2: Install a recommended molded-case circuit-breaker or an earthleakage circuit-breaker (except one used only for protection against ground fault) in the primary circuit of the inverter to protect wiring. At this time, ensure that the circuit breaker capacity is equivalent to or lower than the recommended capacity.
- Note3: If there is a magnetic contactor or a solenoid close to the inverter, connect a surge suppresser to its coil. Keep the wiring length to a minimum.
- Note4: For the wiring of the control circuit, use shielded or twisted wires. When using shielded wires, connect the shields to € G.
 - To prevent malfunction due to noise, keep the control circuit wiring away from the main circuit wiring as far as possible (recommended: 10cm or more), and never set them in the same wire duct. When crossing the control circuit wiring with the main circuit wiring, set them at right angles.
- Note5: Frequency can be set by connecting a frequency setting device (external potentiometer) between the terminals 11 and 13 instead of inputting voltage signal (0 to +10VDC or 0 to +5VDC) between the terminals 12 and 11.
- Note6: (THR) function can be used by assigning code "9" (Trip command) to any of the terminals X1 to X3, or FWD or REV (function code; 60 t to 603, 698, or 699).
- Note7: The three-phase 200V model has the jumper switch status diagrammed below.

The Compact Inverter FRENIC-Mini

Fundamental Functions: F codes

Func. code	Name	Data setting range	Min.	Unit	Factory setting
F00	Data Protection	0 : Disable data protection 1 : Enable data protection	—	—	0
FDI	Frequency Command 1	 0 : Keypad operation (or key) 1 : Analog voltage input (terminal 12) (0 to +10V DC) 2 : Analog current input (terminal C1) (+4 to +20mA DC) 3 : Analog voltage input (terminals 12) and analog current input (terminal C1) 4 : Potentiometer on the keypad 	—	—	4
F02	Running/Stopping and Rotational Direction	0 : Keypad operation (FWD/REV change by external signal) 1 : External signal (Digital input) 2 : Keypad operation (FWD) 3 : Keypad operation (REV)		_	2
F03	Maximum Frequency	25.0 to 400.0Hz	0.1	Hz	50.0 (Three-phase 200V : 60.0)
FBH	Base Frequency	25.0 to 400.0Hz	0.1	Hz	50.0 (Three-phase 200V : 60.0)
FOS	Rated Voltage (at base frequency)	0V : Voltage in proportion to power supply voltage 80 to 240V : AVR active (200V series) 160 to 500V : AVR active (400V series)	1	V	0
<i>F01</i>	Acceleration Time 1	0.00 to 3600s : *0.00 means acceleration time ignored (External soft start/stop)	0.01	S	6.00
F08	Deceleration Time 1	0.00 to 3600s : *0.00 means deceleration time ignored (External soft start/stop)	0.01	S	6.00
F09	Torque Boost	0.0 to 20.0% (percentage against F05: Rated voltage) *Setting becomes valid when F37 is set at 0, 1, 3 or 4.	0.1	%	Fuji's standard torque boost
F 10	Electronic Thermal Overload for motor protection (Select the motor property)	1 : For motor with self-cooled fan, standard motor 2 : For motor with forced-cooled fan		_	1
FII	(Overload detection level)	0.00% (Inactive), Approx. 1 to 135% of inverter rated current	0.01	А	Rated current of Fuji's standard motor
F 12	(Thermal time constant)	0.5 to 75.0min	0.1	min	5.0
F 14	Restart Mode after Instantaneous Power Failure	 0 : Inactive (Trips immediately without restart when power fails.) 1 : Inactive (Trips without restart when power recovers.) 4 : Active (Restarts at frequency output at power failure, for general load) 5 : Active (Restarts at starting frequency, for low-inertia load) 		—	0 (Three-phase 200V : 1)
F 15	Frequency Limiter (Peak)	0.0 to 400.0Hz	0.1	Hz	70.0
F 15	(Bottom)	0.0 to 400.0Hz	0.1	Hz	0.0
	Bias (for Frequency Command 1)	-100.00 to 100.00%	0.01	%	0.00
	DC Braking (Starting frequency)	0.0 to 60.0Hz	0.1	Hz	0.0
F2 I	(Braking level)	0 to 100% (Inverter rated current standard)	1	%	0
523	(Braking time)	0.00 (Inactive), 0.01 to 30.00s	0.01	S	0.00
	Starting Frequency	0.1 to 60.0Hz	0.1	Hz	1.0
F25	Stop Frequency	0.1 to 60.0Hz	0.1	Hz	
725 727	Motor Sound (Carrier frequency) (Sound tone)	0.75 to 15kHz 0 : Level 0	1	kHz	15 (Three-phase 200V : 2) 0
FC1	(Sound tone)	1 : Level 1	_	_	0
		2 : Level 2			
		3 : Level 3			
F 30	Terminal [FMA] (Gain to output voltage)	0 to 200%	1	%	100
F3 I	Analog Output Signal Selection for [FMA] (Monitor object)	Selects from the following items by code. 0 : Output frequency (before slip compensation) 1 : Output frequency (after slip compensation) 2 : Output current 3 : Output voltage 6 : Input power 7 : PID feedback value 9 : DC link circuit voltage 14 : Analog output test (+)			0
F3N	Load Selection/Auto Torque Boost/Auto Energy Saving Operation	 0 : Variable torque load 1 : Constant torque load 2 : Auto-torque boost 3 : Auto-energy saving operation (Variable torque load during acceleration and deceleration) 4 : Auto-energy saving operation (Constant torque load during acceleration and deceleration) 5 : Auto-energy saving operation (Auto-torque boost during acceleration and deceleration) 		_	1
F43	Current Limiter (Operation condition)	0 : Inactive 1 : At constant speed (Inactive during acceleration/deceleration) 2 : During acceleration and at constant speed (Inactive during deceleration)	—	—	0
FHH	(Limiting level)	20 to 200% (Inverter rated current standard)	1	%	200
F 50	Electronic Thermal Overload	0 (Braking resistor built-in type)	1	kWs	999 (Without braking resistor)
_ <u> </u>		1 to 900kWs, 999(cancel)			
- 20	Relay (for braking resistor) (Discharging capability)				0 (With braking resistor)

Note) For the inverter type FRN0.4C1□-2E/J**, the symbol □ is replaced with either of the following alphabets and ** is replaced with any of the following numeral codes: □ : S (Standard type), E (EMC filter built-in type), ** : 21 (Braking resistor built-in type), None (Standard type) The inverter applicable to RS485 communication is limited to the standard ones in three-phase 200V and three-phase 400V series. The braking resistor built-in type is limited to the inverters for 1.5kW or larger

RS485 Communications Card (OPC-C1-RS)

This is an exclusive option that enables the FRENIC-Mini series to use RS485 communication.

The following operations can be performed from the remote keypad (available soon), or from a personal computer, PLC or other host controller using RS485 communication.

Operation functions such as frequency settings, forward, reverse, stop, coast-to-stop and reset.

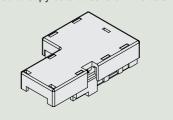

Monitoring of the output frequency, output current, operating status and alarm contents. Setting of function codes

<Transmission Specifications>

Item	Specifications									
Communications protocol	SX Protocol Modbus RTU Support loader exclusive) (Conforming to Modicon's Modbus RTU) Fuji general-purpose inverter protocol									
Electrical specifications	EIA RS-485									
Number of units connected	Host: 1 unit, Inverters: 31 units									
Transmission speed	192	00, 9600, 4800, 2400	bps							
Synchronization system	Start-stop synchronous									
Transmission method	Half-duplex									

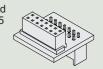

RS485 Communications card case (CASE-C1-RS)

This case is used to house the RS485 communications card. Since the case can be easily attached to or detached from the inverter body, it is conveniently used to copy data to several inverters.

Connector adaptor (TPAD-C1-RS)

This adaptor is used to attach the RS485 communications card case to the inverter body.

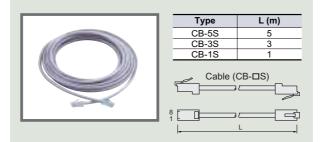

Remote Keypad (TP-E1)

The key pad permits remote control of FRENIC-Mini, and function setting and display (with copy function).

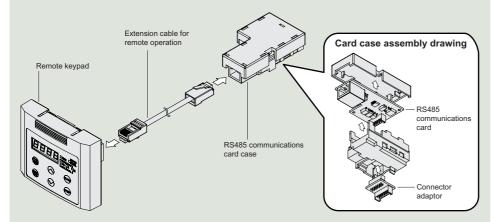

Remote Operation Extension Cable (CB-□S)

This straight cable is used to connect the inverter and the remote keypad, and available in three lengths, i.e. 1m, 3m and 5m.

Copy kit

The copy kit consists of the five options; remote keypad, RS485 communications card case, connector adaptor, and extension cable for remote operation. The copy kit allows the RS485 communications card to be attached with ease and provides convenience when copying data to and from several inverters.

Note) For the inverter type FRN0.1C1S-2E/J**, the symbols ** are replaced with any of the following numeral codes: 21 (Braking resistor built-in type), None (Standard type)

The braking resistor built-in type is limited to the inverters for 1.5kW or larger.

Rail Mounting Base (RMA-C1-□□□)

This is a base for mounting the inverter on a DIN rail (35mm wide).

Note) For the inverter type FRN0.4C1 -2E/J**, the symbol is replaced with either of the following letters and ** is replaced with any of the following numeral codes:

□: S (Standard type), E (EMC filter built-in type), **: 21 (Braking resistor built-in type), None (Standard type)

The inverter applicable to RS485 communication is limited to the standard ones in three-phase 200V and three-phase 400V series.

The braking resistor built-in type is limited to the inverters rated 1.5kW or larger.

For molded-case circuit breakers (MCCB) and earth-leakage circuit breakers (ELCB), the required frame type and series depend on the facility transformer capacity and other factors. When selecting optimal breakers, refer to the relevant technical data. Also select the rated sensitive current of ELCB utilizing the technical data. The recommended wire sizes are based on the temperature inside the panel not exceeding 50°C.

The above wires are 600V HIV insulated solid wires (75° C).

Data in the above table may differ according to environmental conditions (ambient temperature, power supply voltage, and other factors).

Compliance with Standards

1. Compliance with European Standards

The CE marking on Fuji products indicates that they comply with the essential requirements of the Electromagnetic Compatibility (EMC) Directive 89/336/EEC issued by the Council of the European Communities and Low Voltage Directive 73/23/EEC.

Only the EMC filter built-in type of inverters that bear a CE marking are compliant with these EMC Directives.

Inverters that bear a CE marking or TUV mark are compliant with the Low Voltage Directive.

The products comply with the following standards:

Low Voltage Directive EMC Directives

EN50178 :	1997						
EN61800-3 :	1996+A11 : 2000						
EN55011 :	1998+A : 1999						
Immunity :	Second environment						
	(EN61800-3+A11 Industrial)						
Emission :	Class 1A (EN55011+A1)						
(Applicable only to the EMC filter built-in type of inverters)							

CAUTION

The FRENIC-Mini series of inverters are categorized as a "restricted sales distribution class" of the EN61800-3. When you use these products with any home appliances or office equipment, you may need to take appropriate countermeasures to reduce or eliminate any noise emitted from these products.

2. Compliance with EMC Standards

General

The CE marking on the EMC filter built-in type of inverters does not ensure that the entire equipment including our CE-marked products is compliant with the EMC Directive. Therefore, CE marking for the equipment shall be the responsibility of the equipment manufacturer. For this reason, Fuji's CE mark is indicated under the condition that the product shall be used within equipment meeting all requirements for the relevant Directives. Instrumentation of such equipment shall be the responsibility of the equipment manufacturer. Generally, machinery or equipment includes not only our products but other devices as well. Manufacturers, therefore, shall design the whole system to be compliant with the relevant Directives.

In addition, to satisfy the requirements noted above, use the EMC filter built-in type of inverters according to the descriptions contained in this instruction manual. Installing the inverter(s) in a metal enclosure may be necessary, depending upon the operating environment of the equipment that the inverter is to be used with.

Recommended installation

To make the machinery or equipment fully compliant with the EMC Directive, have certified technicians wire the motor and inverter in strict accordance with the procedure described below.

Use the EMC filter built-in type of inverters.

(1) Mount the EMC grounding flange (that comes with the inverter) to the inverter with screws in order to ground the wire shield(s). (See Figure 1.)

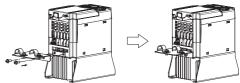

Figure1. Attaching the EMC Grounding Flange

(2) Use shielded wires for the motor cable and route it as short as possible. Firmly clamp the wire shield to the flange to ground it. Further, connect the wire shield electrically to the grounding terminal of motor. (See Figure 2.)
(3) Use shielded wires for the control signals of the inverter to input to/output from the control terminals. Firmly clamp the control wire shields to the EMC grounding flange (in the same way as the motor cables.)

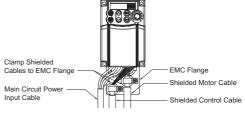

Figure2. Connecthing Shielded Cables

(4) If noise from the inverter exceeds the permissible level, enclose the inverter and its peripherals within a metal enclosure as shown in Figure 3.

The Compact Inverter FRENIC-Mini

Application to standard motors

Driving a 400V standard motor

When driving a 400V standard motor by an inverter with long cable lengths, damage may occur in the insulation of motor. Use the output circuit filter (OFL) if necessary after confirmation with the motor manufacturer. The use of Fuji Electric Motor does not require the output circuit filter because of its reinforced insulation.

Torque characteristics and temperature rise

When the inverter is used to operate a standard motor, the temperature rises higher than during operation from a commercial power supply. The cooling effect decreases in the low-speed range, reducing the allowable output torque. (If a constant torque is required in the low-speed range, use a Fuji inverter motor or a motor equipped with a separately ventilating fan.)

Vibration

Use of an inverter does not increase vibration of a standard motor, but when the motor is mounted to a machine, resonance may be caused by the natural frequencies including the natural frequency of the machine system.

* We recommend that you use a rubber coupling or anti-vibration rubber.

* We also recommend that you use the inverter jump frequency control function to avoid resonance point in the motor operation.

Note that operation of a 2-pole motor at 60Hz or over may cause abnormal vibration.

Noise

When an inverter drives a standard motor, the motor noise level increases compared with driven by commercial power. To reduce noise, set the inverter carrier frequency at a high level. High-speed operation at 60Hz or over can result in more noise.

Application to special motors

Explosion-proof motors

When driving an explosion-proof motor with an inverter, use a combination of a motor and an inverter that has been approved in advance. Such approved products are available in our special product series. Contact Fuji for details.

Submersible motors and pumps

These motors have a larger rated current than standard motors. Select the inverter capacity so that these motors can run within the inverter rated current. These motors differ from standard motors in thermal characteristics.

Set a small value according to the thermal time constant of motor for setting electronic thermal relay function.

Brake motors

Do not use motors with parallel-connected brakes that obtain the brake power from the primary circuit (commercial power supply). If you connect the brake power to the inverter power output circuit by mistake, problems may occur.

Do not use inverters for driving motors equipped with series-connection brakes.

Geared motors

When the power transmission mechanism uses an oil-lubricated gearbox or speed changer/reducer, continuous motor operation at low speed may cause poor lubrication.

Synchronous motors

Synchronous motors cannot be driven by FRENIC-Mini inverter.

Single-phase motors

Single-phase motors are not suitable for inverterdriven variable speed operation. Use three-phase motors.

* Even if a single-phase power supply is available, use a three-phase motor, because the inverter provides three-phase output.

Combination with peripheral device

Installation location

Use the inverter in an ambient temperature range between -10 to 50 C.

The inverter and braking resistor surfaces become hot under certain operating conditions. Install an inverter on non-flammable material.

Installing Fuji Auto Breaker (MCCB)

Install a Fuji Auto Breaker (MCCB) or earth-leakage circuit breaker in the primary circuit of the inverter to protect wiring.

Magnetic contactor in the secondary circuit

If a magnetic contactor is mounted in the secondary circuit for switching the motor to commercial power or for any other purposes, ensure that the inverter and the motor are stopped before you turn on or off the contactor.

Magnetic contactor in the primary circuit

Do not open or close the magnetic contactor in the primary circuit more than once an hour. If frequent starts or stops are required during motor operation, send FWD or REV signals to the control terminal.

Protecting the motor

When you drive a motor with an inverter, the motor can be protected with an electronic thermal relay function of the inverter. In addition to the operation level, set the motor type (standard motor, inverter motor). For high-speed motors or water-cooled motors, set a small value in the thermal time constant to protect the motor in combination with the cooling system OFF signal. When driving several motors with an inverter, connect a thermal relay to each motor and turn on the inverter s electronic thermal relay function. If you connect the motor thermal relay to the motor with a long cable. high-frequency current may flow into the wiring stray capacitance. This may cause the relay to trip at a current lower than the set value for the thermal relay. If this happens, lower the carrier frequency or use the output circuit filter (OFL).

Power-factor correcting capacitor

Do not mount the power-factor correcting capacitor in the inverter primary circuit. (Use the DC reactor to improve the inverter power factor.) Do not use the power-factor correcting capacitor in the inverter secondary circuit. Overcurrent trip will occur, disabling motor operation.

Reducing noise

Use of filter and shielded wires are typical measures against noise that meets EMC Directives. For details, refer to the operation procedure manual.

Measures against surge current

If OV trip occurs while the inverter is stopped or operated under a light load, it is assumed that the surge current is generated by open/close of the phase-advancing capacitor in the power system. * Connect a DC reactor to the inverter.

Megger test

When checking insulation resistance of the inverter, use a 500V megger and follow the instructions described in the instruction manual.

Wiring

Control circuit wiring length

When using remote control, limit the wiring length between the inverter and operator box to 20m or less and use twisted shielded cable.

Wiring length between inverter and motor

If long wiring is used between the inverter and the motor, the inverter will overheat or trip because of overcurrent (under the influence of high-frequency current flowing into the stray capacitance) in the wires connected to the phases. Ensure that the wiring is shorter than 50m for models 3.7kW or Isrger. If these lengths must be exceeded, lower the carrier frequency or mount an output circuit filter (OFL). When wiring is longer than 50m, and Dynamic

torque-vector control is selected, execute off-line tuning.

Wiring size

Select a cable with a sufficient capacity by referring to the current value or recommended wire size.

Grounding

Securely ground the inverter using the grounding terminal.

Selecting inverter capacity

Driving standard motor

Select an inverter from the capacity range of nominal applied motors shown in the inverter standard specifications table. When large starting torque is required or acceleration or deceleration is required in a short time, select an inverter with a capacity one size greater than the standard.

Driving special motor

Select an inverter that meets the following condition: Inverter rated current > Motor rated current

Transportation, storage

When transporting or storing inverters, select the procedures and places that meet the environmental conditions given in the inverter specifications. Ensure that the above environmental conditions are met also when transporting an inverter mounted to a machine.
