## Highlight of benefits

### One family

- Designed for general purpose applications
- For both constant and variable torque applications
- Just one drive series to run an entire production line
- Broad range: 180W to 1.4 MW, 230 V – 690 V

### Designed for lifetime

- Built-in DC chokes increase the lifetime of the capacitors
- Conformal coating available

### Low operating costs

- Low energy consumption – up to 98% efficiency
- Less energy needed for cooling
- Automatic Energy Optimizer (AEO) potentially saves up to 5% energy compared to standard drives
- Low cost of ownership – no periodic maintenance/ replacement cost
- Energy saving up to 40% depending on the application

## Constant torque applications Heavy Duty

Constant torque applications include those where the load does not change significantly with the speed as conveyors, lifting gear and mixers.

A motor block on a conveyor will always weight the same, regardless of whether the conveyor is running at low or high speed.

The torque required to move this motor block is always the same. Although friction and acceleration torques will vary depending on the operating state, the torque requirement for the load remains constant.

The power required by a system of this type is proportional to the torque required and to the speed of the motor.

Savings can be achieved directly if the speed can be reduced at constant load. Adapting the speed of the belt to the quantity of goods to be transported not only enables those goods to be processed without interruption but also leads to a reduction on the energy required.

Even if it is not possible or desirable to adapt the speed, most speed drives will still bring about reductions in energy consumption, since they regulate the motor's output voltage depending on load and as the load rises, it will increase the voltage.

## Variable torque applications Light Duty

Often involve pumps and fans. However, a distinction has to be made in the case of pumps. Although the most popular types of centrifugal pump have a quadratic torque characteristic but eccentric, vacuum or positive displacement pumps have a constant torque characteristic. Pumps and fans have a significant share of all power consumed by industrial applications, with consumption levels approximately at 40%. Speed control is a simple yet very effective way of saving energy where fans and pumps with variable load torques are concerned.

Reducing the speed generates a cubic reduction in energy requirements. This significant potential for savings makes all applications with variable torque ideal candidates for the implementation of energy saving. Operators need to take into account that changes in speed alter the operating point and affect the efficiency. If the difference between the maximum power required and average part-load operation is too great, systems should be cascaded. It is often the case that investments pay for themselves relatively quickly when existing systems are converted.

## Built-in class A2 RFI filter

- Drive is ready to use and faults due to incorrect installation or wrong filter selection are avoided
- No over sizing of drive necessary – with motor cables of up to 300m, depending of the power rating of the drive
- Immunity from electrical interference and minimal emission
- Saves panel space and installation costs
- A1 and B1 filter also available as factory option
- Facilitates meeting CE EMC directives (requirement for EU markets)

## Built-in DC link reactor

- Low harmonic emission: THDi < 48%
- No voltage drop => full output voltage
- Reduces installation cost
- Fulfls EN 61000-3-2/3-12
- True power factor 0.9

## Reliable operation in harsh environment

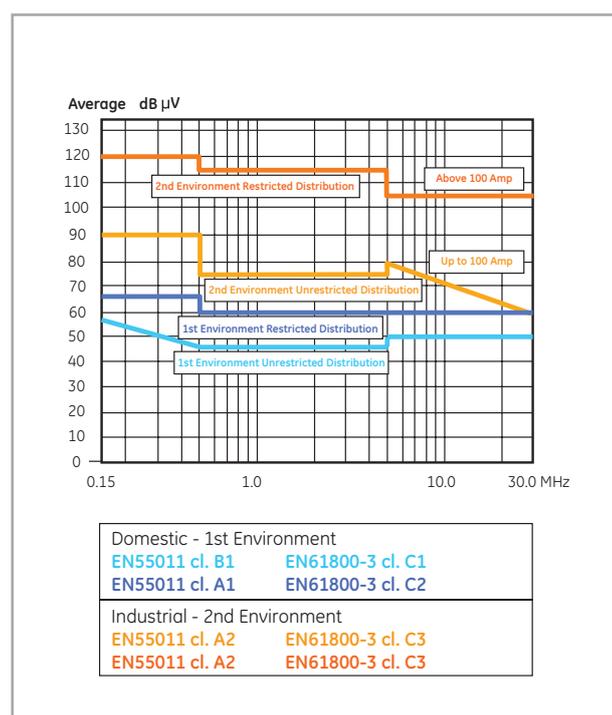

- Protection against environmental pollution, aggressive gasses, moisture and dust
- Reduces the probability of failure resulting in less down-time
- Increases the lifetime of the drive
- High protection Class 3C2 **as standard** and increased protection in harsh environments with Class 3C3 **as optional**
- Optional conformal coating is tested to ANSI/ISA S71.04-1985 Class G3 (airborne gasses - harsh) and Class GX (airborne gasses - severe)

## Intelligent heat management

- Cooling fans are easily cleaned without touching the electronics
- 100% cooling air via segregated rear heat-sink– protects the electronic against aggressive environments
- Temperature controlled fan

## High immunity

- Immunity to fluctuating supply voltage (+/- 10%)
- Efficient overvoltage protection
- Fully short-circuit- and earth-leakage proof
- 100kA prospective short-circuit current capability

## AF-600 FP - Special pump functions

### No flow detection

- No flow detection is based on speed and power
- Two sets of data must be programmed into the drive
- Manual or auto set up
- Used to enable sleep mode in closed loop systems for energy savings

### End-of-curve protection

- If there is a water leak in the pipe, it will not produce pressure
- The pump is delivering a large volume of water but cannot maintain the static head
- Drive will go to full flow to try producing pressure (set point)
- The drive running at high speed with a feedback signal less than 97.5% of the set point pressure causes End of Curve action

### Dry pump protection

- Special no-flow condition, where pressure can not be produced, if there is no water
- Drive will go to full speed to try producing full pressure
- Low power consumption at high speed causes Dry Pump action

## PC software tool DCT-10

One PC tool for all tasks

## Common accessories

(1) If a braking chopper is required, it has to be requested during the order. It is not an external option (only available for AF-650 GP).  
 (2) EMC filter are built inside all drives. It is not an external option.

### Harmonic filter

- Available from 10 to 613A at 380 – 415V 50Hz and from 43 to 370A at 690V
- Comply with IEEE 519-1992 and stage 1 of EN 61000-3-12
- Specially designed for unmatched harmonic performance.
- Small foot print and high harmonic reduction

The harmonic current distortion generated back to the mains is reduced to 5 and 10% total harmonic current distortion at full load. With an efficiency higher than 98%, those passive filter are compact and very robust harmonic solution specifically for power up to 400kW.

#### Reliable

Fully tested and based on proven filter concept... low failure rate

#### Savings

High efficiency... low running expenses

#### Design

Side-by-side mounting... less space needed

Easy commissioning... reduce costs

## What accessory for the drive output?

### Specifications

Performance criteria	dU/dt filter	Sine-wave filter
<b>Motor insulation stress</b>	Up to 100m cable (shielded/unshielded) complies with the requirements of IEC60034-17*. Above this length, the risk of double pulsing increases.	Provides a sinusoidal phase-to-phase motor terminal voltage. Complies with the requirements of IEC60034-17* with cables up to 500m (1km for frame size 4x and above)
<b>Motor bearing stress</b>	Slightly reduced, mainly in high power motors.	Reduces bearing currents caused by circulating currents. Does not reduce common-mode currents (shaft currents).
<b>EMC performance</b>	Eliminates motor cable ringing. Does not change the emission class. Does not allow longer motor cable as specified for the speed drive's built-in RFI filter.	
<b>Max. motor cable length</b>	100 - 150m With guaranteed EMC performance: 150m shielded Without guaranteed EMC performance: 150m unshielded	With guaranteed EMC performance: 150m shielded and 300m unshielded (only conducted emissions) Without guaranteed EMC performance: up to 500m (1km for frame size 4x and above)
<b>Acoustic motor switching noise</b>	Does not eliminate acoustic switching noise from the motor.	Eliminate acoustic switching noise from the motor caused by magnetostriction.
<b>Size</b>	15 - 50% (depending on power size)	100%
<b>Price</b>	50%	100%

### dU/dt filter

dU/dt filters reduce the dU/dt values on the motor terminal phase-to-phase voltage – an issue that is important for short motor cables. Available from 27 to 880A

Perfect match for applications with older motors, with frequent braking and for short motor cable length (up to 150m) dU/dt filters are differential-mode filters which reduce motor terminal phase-to-phase peak voltages spikes and reduce the rise time to a level that lowers the stress on the insulation of motor windings. They have a cut-off frequency above the switching frequency. The voltage at the motor is still PWM pulse shaped but the rise time and U<sub>peak</sub> are reduced. Since they have smaller inductance and capacitance, the dU/dt filters introduce a negligible reactance between the speed drive and the motor, therefore suitable for high dynamic applications.

Output chokes cause undamped oscillations at the motor terminals which increase the risk of double pulsing and overvoltages higher than twice the DC link voltage. The dU/dt filters are low-pass L-C filters with a well defined cut-off frequency, therefore, the ringing oscillations are damped and there is a reduced risk of double pulsing and voltage peaks.

**Benefits**

- Reduces dU/dt stresses... increase motor service interventions
- Ideal for highly dynamic applications with flux vector regulation... smaller and less expensive than sine-wave filters
- Side-by-side mounting... less space needed

### Specifications

Mains voltage	3 x 200 - 690V
Frequency	0-60Hz without derating Max 100Hz (with derating)
Overload current	160% for 60s, every 10 minutes
Minimum/Maximum switching frequency	fmin = 1.5 to 5kHz (depending on filter type) fmax = 8kHz
Ambient temperature	-25° to 45°C without derating

### Sine-wave filter

Sine-wave output filters are low-pass filters that suppress the switching frequency from the drive and smooth out the phase-to-phase output voltage to become sinusoidal. This reduces the motor insulation stress and bearing currents.

Available from 2.5 to 800A.

Perfect match for applications with older motors, with frequent braking, for 690V applications and for motor cable length above 150m.

**Benefits**

- The switching acoustic noise from the motor is eliminated.
- Reduces hysteresis thermal losses in the motor... prolongs the lifetime of the motor.
- Suppress any bearing currents in the motor... reduces risk of flashover in the motor bearings and also contributes to extend motor lifetime and increase service intervals.

## Dynamic Braking Resistors

Dynamic braking allows for faster deceleration rates than could be achieved via a coast to stop. Dynamic braking consists of the internal drive brake chopper and separate add-on dynamic braking resistors.

Important application notes:

- The AF-60 LP Micro Drive dynamic braking can be used for stopping a load with an inertia equal to or less than the applied motor's rotor inertia.
- High inertia or overhauling loads may cause extended deceleration times which could cause overheating and tripping of the drive.
- The dynamic braking is not a holding brake. It does not prevent a motor at rest from rotating.

Note: refer to the drives' Operating Instruction for installation and connection details.
